# Overview

# About the Speaker

Member of CERN Beams Controls Group:  
Responsible for JMS Service Middleware  
Developer for Alarm and Monitoring System

[felix.ehm@cern.ch](mailto:felix.ehm@cern.ch)

Previous Activities:  
Large Storage Systems  
Grid Environment

# What is CERN ?

A European Organization for Nuclear Research

originally : Conseil Européen pour la Recherche Nucléaire

- Founded in 1954
- Based in Geneva, Switzerland
- 3'000 staff members
- 8'000 visiting scientists
- Financed by its member states

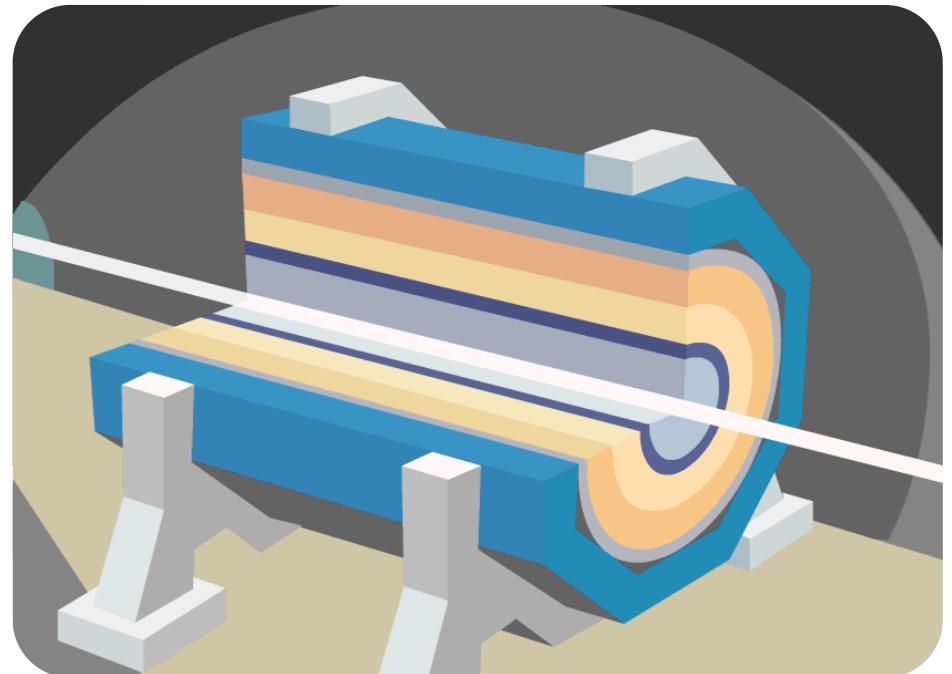

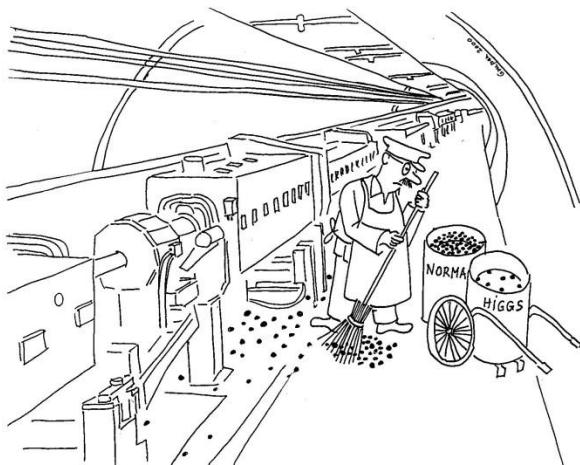

Twenty Member States

 AUSTRIA (1959)	 DENMARK (1953)	 GREECE (1953)	 NORWAY (1953)	 SPAIN (1/1961-12/1968-1/1983)
 BELGIUM (1953)	 FINLAND (1991)	 HUNGARY (1992)	 POLAND (1991)	 SWEDEN (1953)
 BULGARIA (1999)	 FRANCE (1953)	 ITALY (1953)	 PORTUGAL (1986)	 SWITZERLAND (1953)
 CZECH FR (1993)	 GERMANY (1953)	 NETHERLANDS (1953)	 SLOVAK FR (1993)	 UNITED KINGDOM (1953)

# Large Machines for High Energy Physics

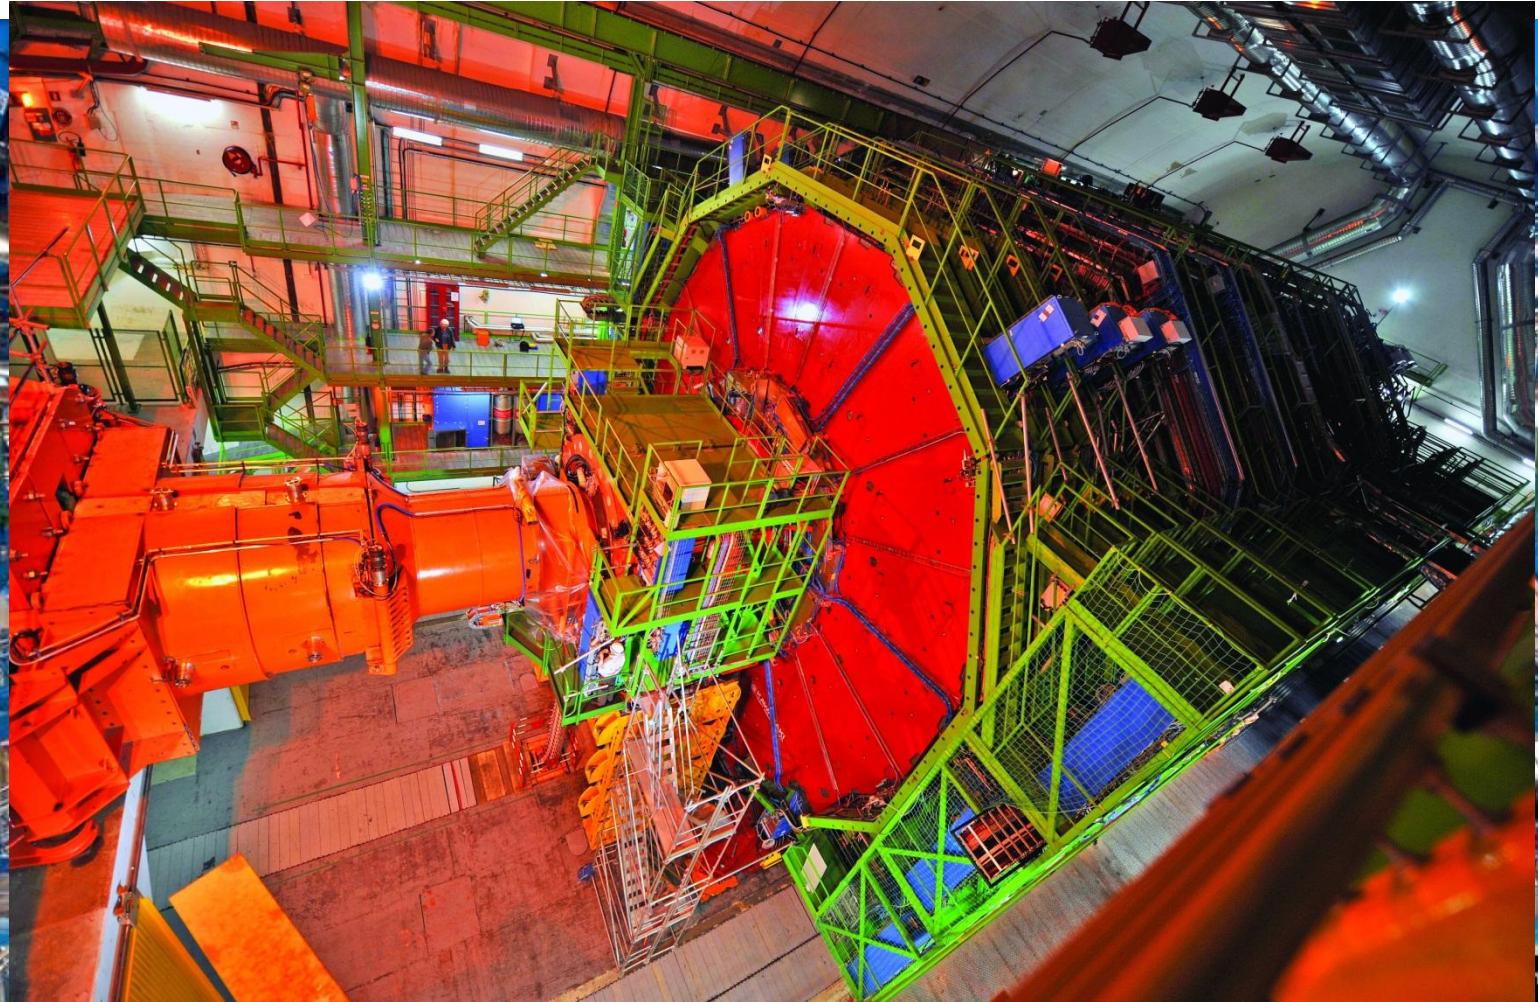

Particle colliders for  
tracing “fragments”

# Controls Architecture

**JMS Purpose:**  
**Reliable and scalable** transport of data between Java processes

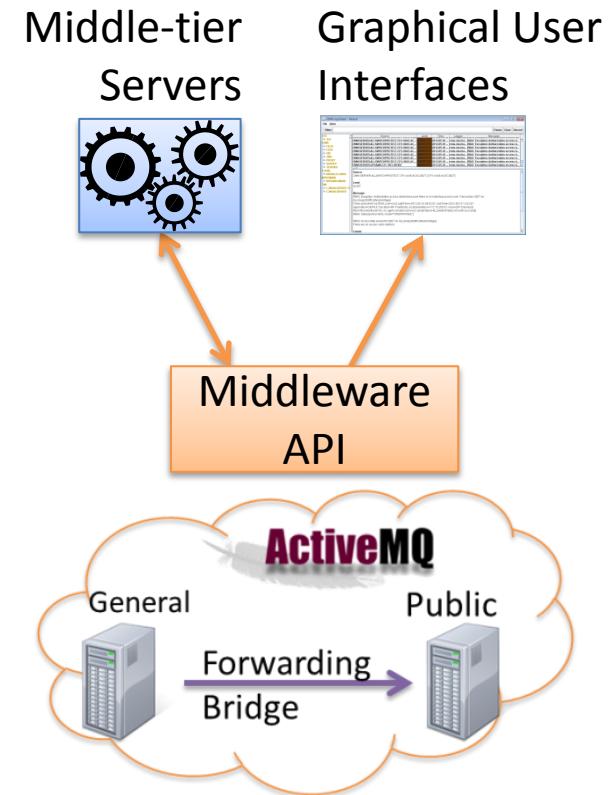

# History

- Early use of ActiveMQ already in 2005
  - We were looking for a free JMS solution
  - Apache? Can't be bad!
- Why OpenSource ?
  - Low Costs
  - We can **read and check** the code
  - We can add / fix code

# History – First Setup

- Clients
  - Java **middle-tier servers** and **GUIs**
- Data access for Clients via Middleware API
- Two interconnected Brokers

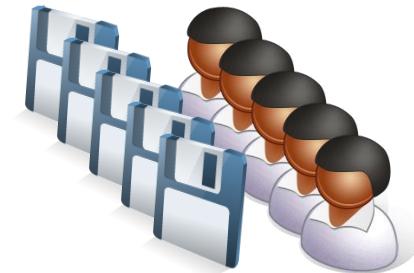

Simple Setup, few projects, little data,  
easy to use. Did the job!

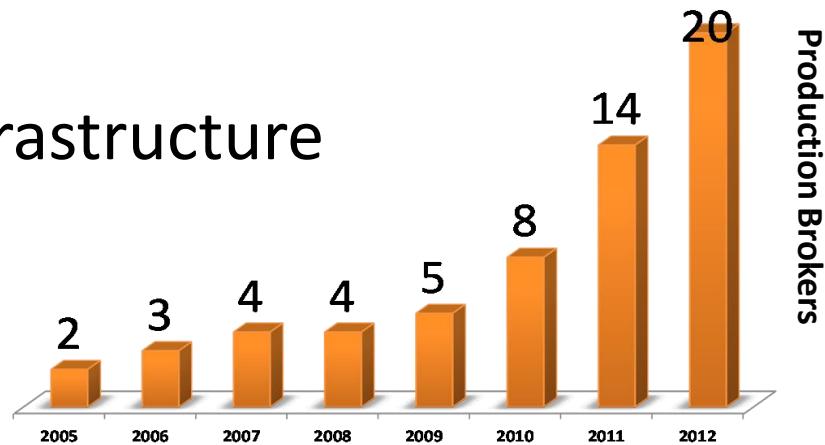

# History - Evolution

- But: Service suffered by its own success
  - More users and more data was sent around
  - Higher QoS was requested
    - Redundancy
    - Queues, persistent messaging and global transactions (XA)
  - Support for non Java clients

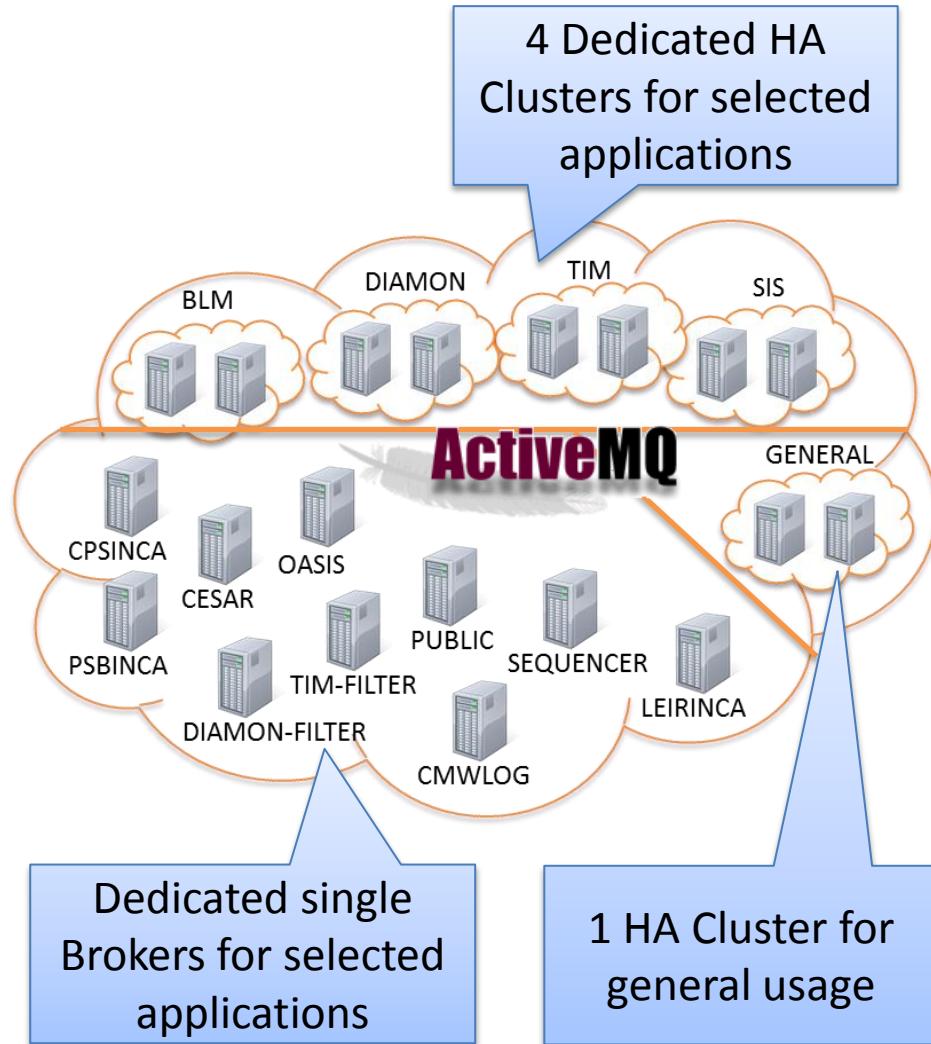

- We needed to adapt the infrastructure  
and needed to **SCALE**

# Deployment Today

- 20 Production Brokers
  - 10 single Brokers
  - 5 HA Clusters
- No one large cluster but **manageable entities**
- **Vital part** of beam instrumentation and operation

**No JMS –  
No Particle Physics !**

# Deployment Today - Setup

- HA Clusters
  - 2 equivalent broker members, no master-slave
  - Two (real) machines with **separate network links**
- Single Broker
  - For projects which do not require HA
  - Deployed on same (real) machine as middle-tier server
- Local secured network together with Producers and Consumers
- Fuse ActiveMQ Distribution since 2010
  - Issues solved faster in service packs

# Deployment Today

*Some numbers :*

- *300 Applications*
- *4'400 Connections*
- *40'000 Subscriptions*
- *85'000 Topics*
- *68'000 Consumers*
- *8 Million msg/h IN,  
3.5M msg/h OUT*

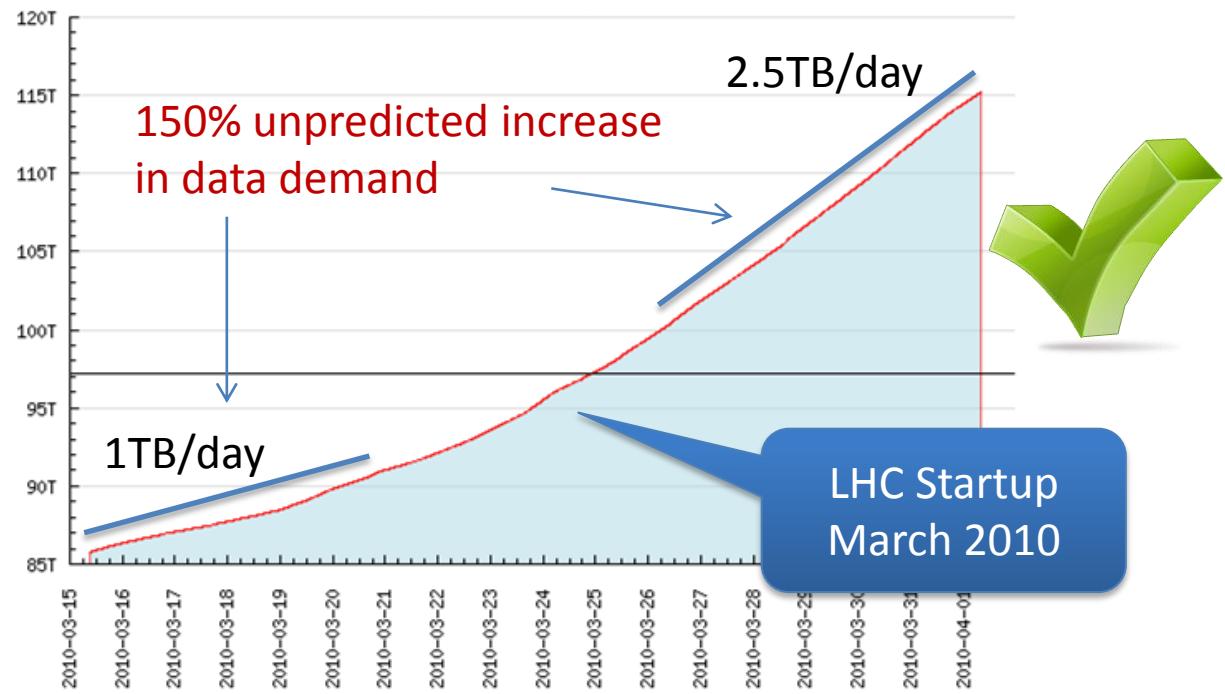

Archived Uptime  
in 2011: 99.98%

Not all data which  
is produced is  
consumed

# Example of Data Handling during LHC Startup 2010

Output Data Handling  
for 1 Broker of the  
General Broker Cluster

# Usage Cases

## Usage Case 1

- **Payload  
2MByte**
- 1 msg/sec
- 1 Topic
- 20-30 Java Clients

## Usage Case 2

- Payload 500Bytes- 1KBytes
- 30-200 msg/sec
- 120 Queues
- **4 Million XAS/day**
- 2 Clients

## Usage Case 3

- Payload 200Byte - 10KByte
- **50-4500 msg/sec**
- **10'000 Topics**
- 2-5 Clients

## Usage Case 4

- Payload <200 Bytes
- <10 msg/hour
- 1 Queue
- **< 10 STOMP Clients**

ActiveMQ

Scalability

Reliability

Versatility

Flexibility

# OPERATION

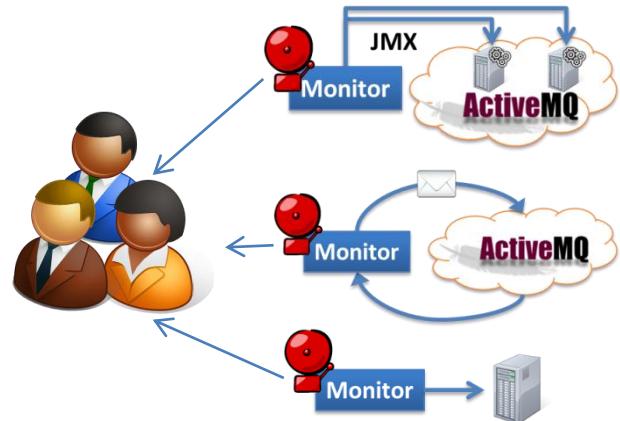

European Organization for Particle Physics  
*Organisation européenne pour la physique des particules*

[www.cern.ch](http://www.cern.ch)

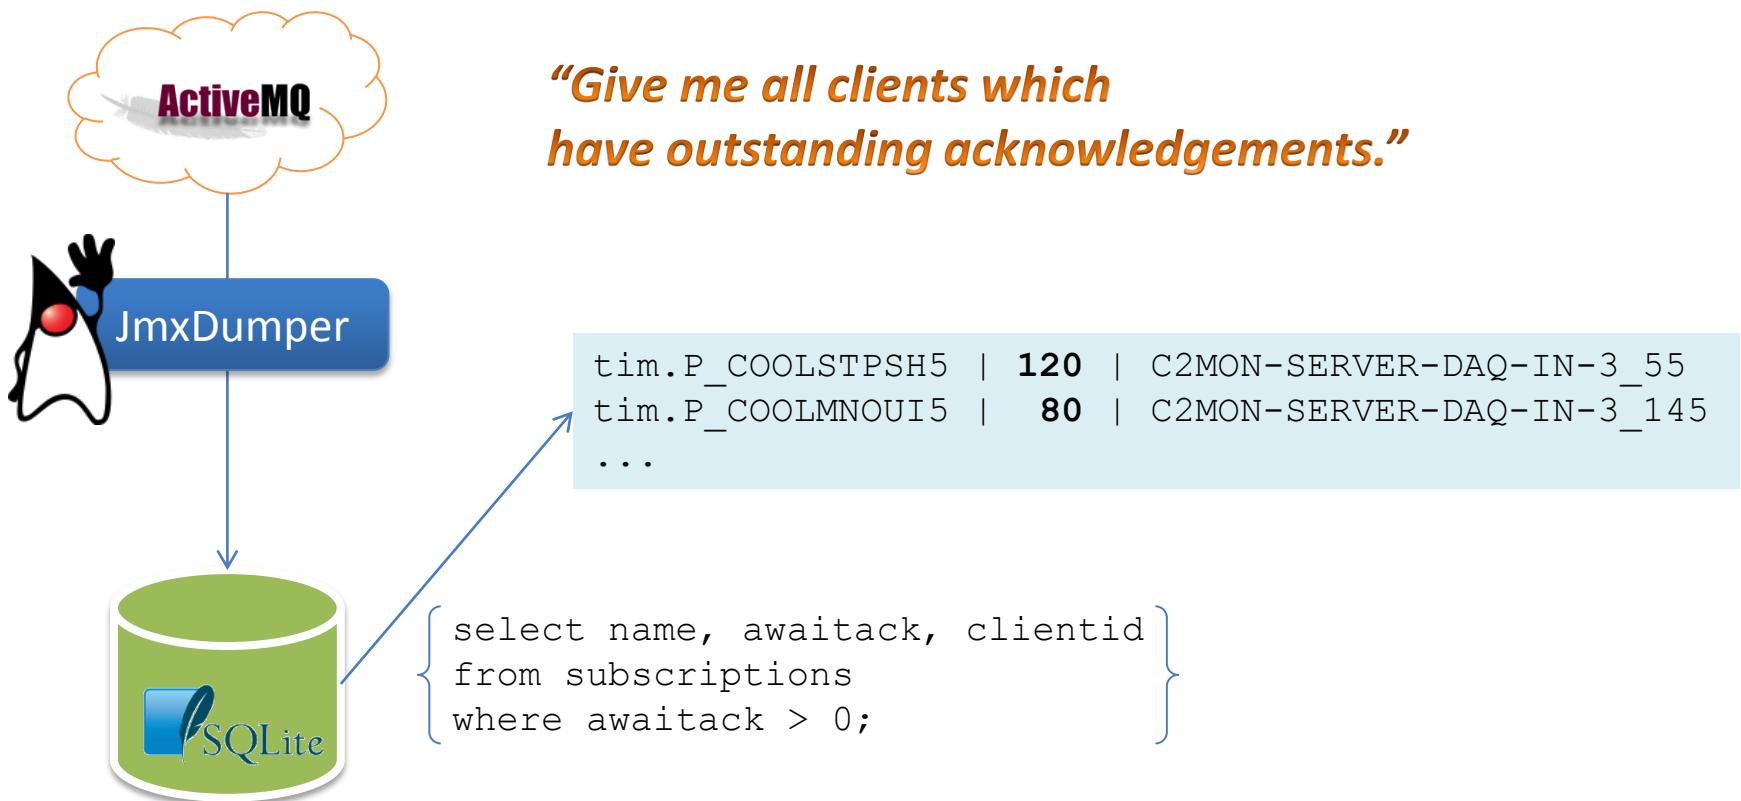

# Management of Brokers

- Monitoring
  - via JMX
  - Submission of test message
  - Host machine monitoring
- Deployment
  - Rollout scripts for deploying/rollback
  - Configuration changes tracked in SVN

# Diagnostic Tools

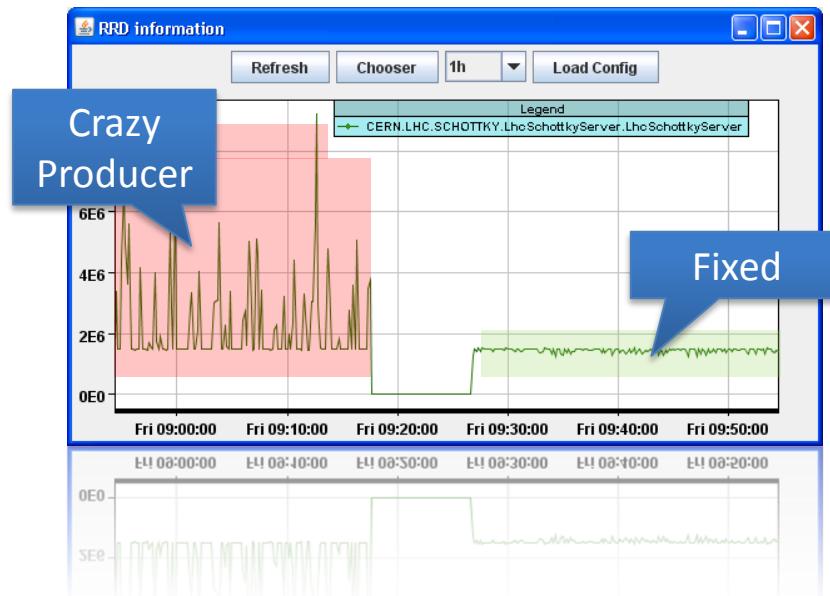

Dump JMX information into SQLite database for **fast, easy and intuitive** access.

# Diagnostic Tools

## Traffic Monitoring Tool

- Collecting information by **listening** on Topic
  - Message size & speed
- Allows **history view** on
  - Average Message throughput
  - Average Message size

# Lessons learnt - Operation

- Separate usage cases from each other
  - Easier than implementing per destination policies
  - Broker restart does not affect others
- More clients, more memory
- Broker does not die when hitting memory limits
- Check if you need all features
  - Maintenance overhead vs. failure probability & effect

# Lessons learnt - Configuration

- Disable DedicatedTaskRunner: takes many threads
- Reduce the PrefetchLimit on clients side
- Couldn't get Broker discarding messages
  - ConstantPrefetchLimit unset + brain-dead client  
= Out of Memory
- **Memory is important**
  - But GC takes longer
  - New Java GC options help

```
-XX:+UseConcMarkSweepGC  
-XX:+CMSIncrementalMode  
-XX:+CMSIncrementalPacing  
-XX:CMSIncrementalDutyCycleMin=0  
-XX:CMSIncrementalDutyCycle=10  
-XX:+HeapDumpOnOutOfMemoryError
```
