# What is Enterprise Integration?

- The use of software or hardware to integrate a set of internal and external enterprise applications and services by applying the architectural principles and patterns for computer systems.

# Purpose

## Data consistence

- Ensures that information in multiple systems is kept consistent with data integrity.

## Service interactions

- Enable inter-system or inter-application communications

## Product independence

- Extracts business policies or rules from applications and implements them in the integration system, so that even if one of the business applications is replaced with a different vendor's application, the business rules do not have to be re-implemented.

## Common facade

- An integration system can front-end a cluster of applications, providing a single consistent access interface to these applications and shielding users from having to learn to use different software packages.

# Value Prop

Simplify and automate business processes

Avoid having to make sweeping changes to the existing applications or data structures.

Unrestricted sharing of data and business processes among any connected application or data sources in the enterprise.

Reduce the inter-dependency and tight coupling among applications

# Pros and Cons

## Advantages

- Real time information access among systems
- Streamlines business processes and helps improve organizational efficiency
- Maintains information integrity across multiple applications
- Ease of development and maintenance

## Disadvantages

- High initial development costs, especially for small and mid-sized businesses (SMBs)
- Require a fair amount of up-front business design, which many managers are not able to envision or not willing to invest in.
- Fairly steep learning curve for inexperienced teams to get on board

# Core Functions

## Connection

messaging formats, communications protocols, connectivity alternatives

---

## Mediation

dynamic provisioning, transformation, mapping, transaction management, policy enforcement, registry, SLA

---

## Orchestration

BPMN, BPEL, long-running process

---

## Quality of services

fault tolerance, HA, scalability, throughput, topology, and extensibility

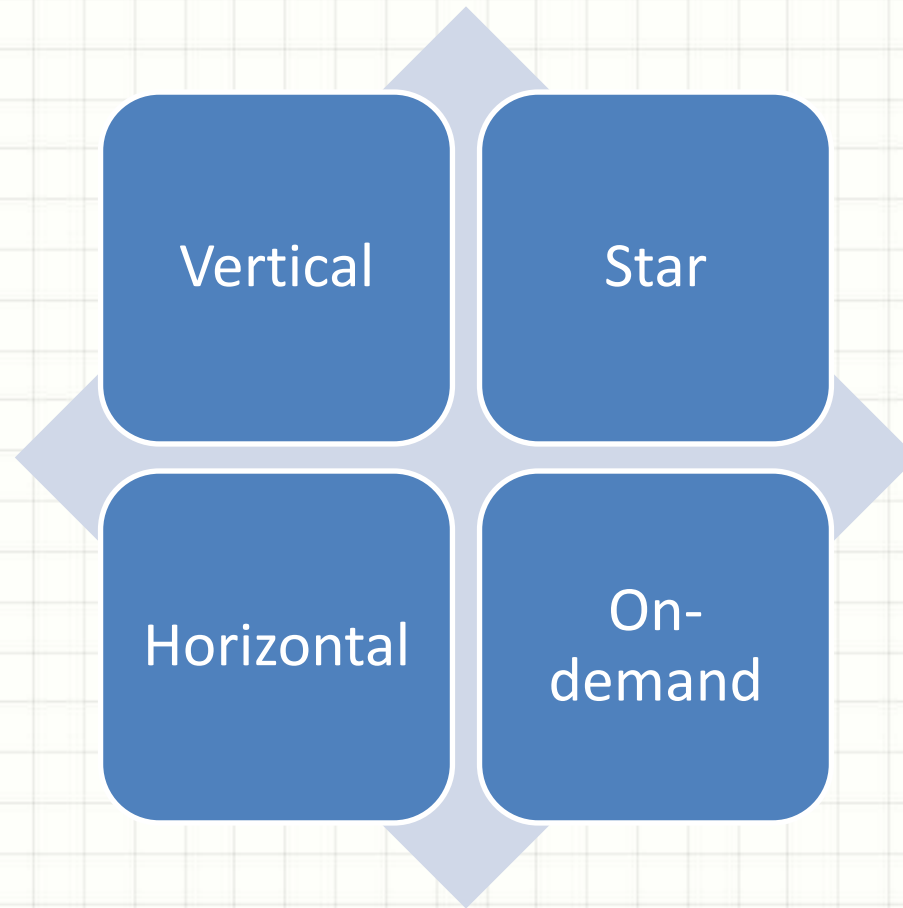

---

## Change and control

lifecycle management, monitoring, design tools, security

---

# Integration Approach

# Comparison of Integration Approaches

| Method            | Description                                                                  | Strength                                                   | Weakness                                                           | Implementation                            | Note                        |
|-------------------|------------------------------------------------------------------------------|------------------------------------------------------------|--------------------------------------------------------------------|-------------------------------------------|-----------------------------|
| <b>Vertical</b>   | Integrate subsystems                                                         | Fast integration<br>-> cheaper cost in short term          | Poor maintainability                                               | OOP, RMI                                  | Silos inhibiting reuse      |
| <b>Star</b>       | interconnecting                                                              | Flexibility of reuse of functionality                      | Rising cost for heterogeneous platforms and proprietary interfaces | MQ, MB, Pub/Sub, WS SOAP/REST, JSON       | Point to point connectivity |
| <b>Horizontal</b> | Specialized engine                                                           | Significantly cut the number of interfaces                 | Overheads and platform dependency                                  | ESB, integration engine, EII              | Loosely coupled             |
| <b>On-demand</b>  | Dynamically bound to available services in the pool or discovered on the fly | Choose best-of-breed services with best cost-effectiveness | Unreliable SLA and security concerns                               | Integration Platform as a Service (IPaaS) | Emerging and maturing       |

# Integration Solutions

## Patterns

- Mediation (intra-communication)
- Federation (inter-communication)
- Access (sync vs async)
- Duration (short-lived vs long-running)

## Topology

- 1 to 1
- Hub and spoke
- Bus

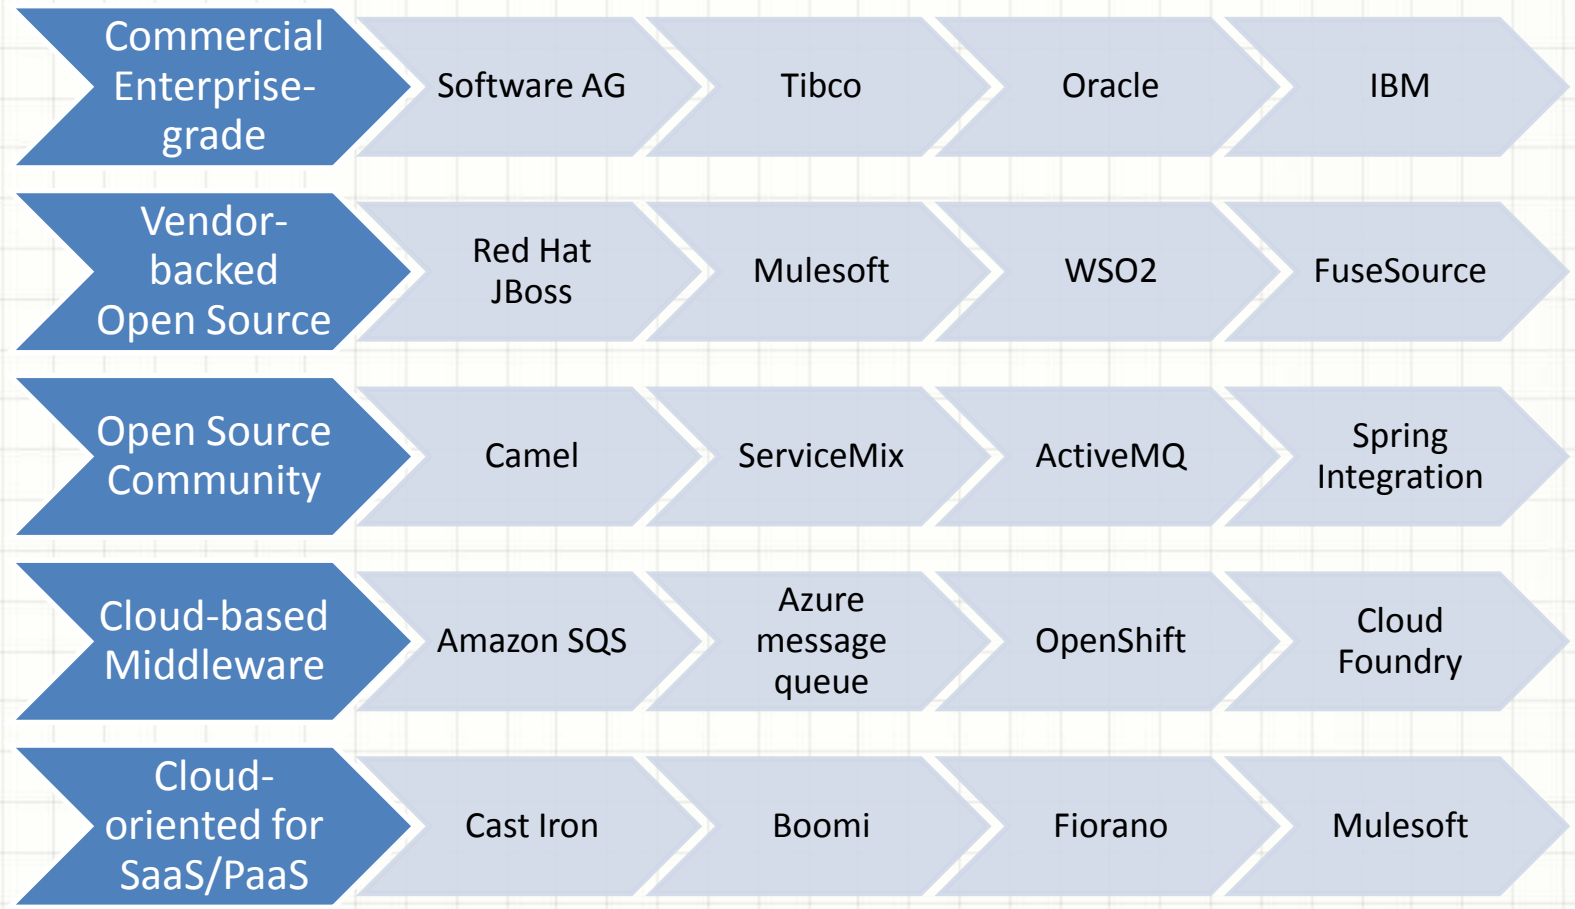

## Techniques

- Pipe
- Adapter
- Data format transformation
- Pub/Sub
- Transaction (1-phase and 2-phase commit)
- Share-nothing

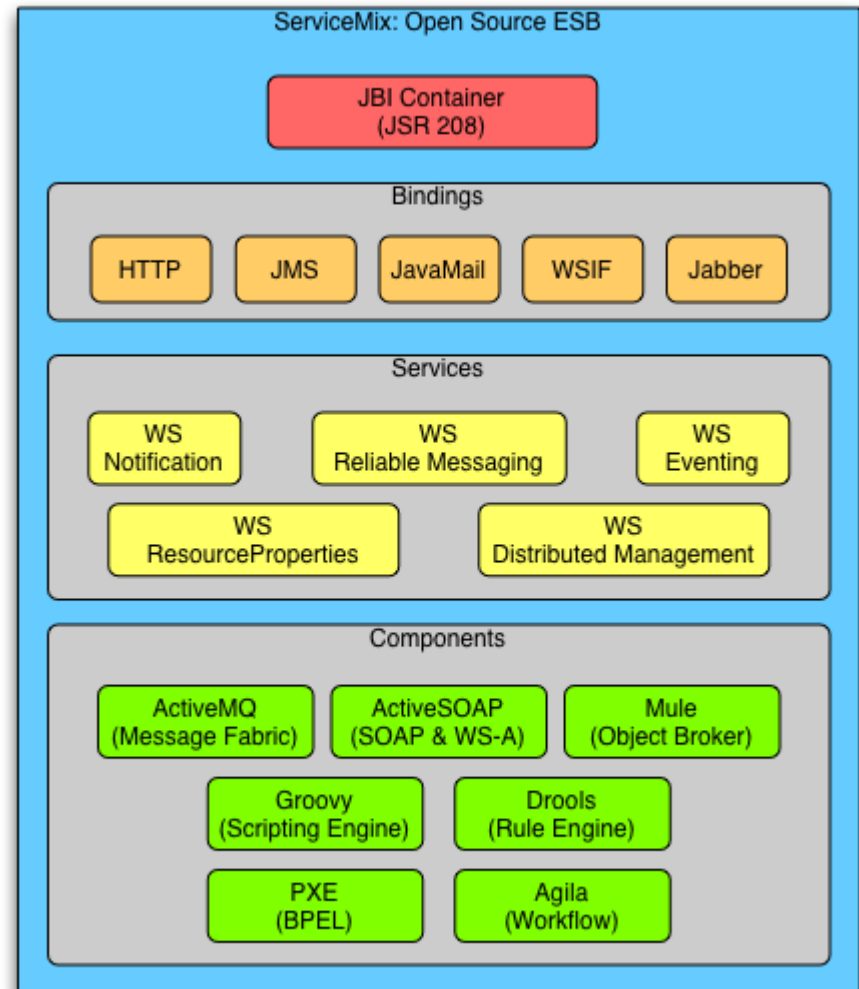

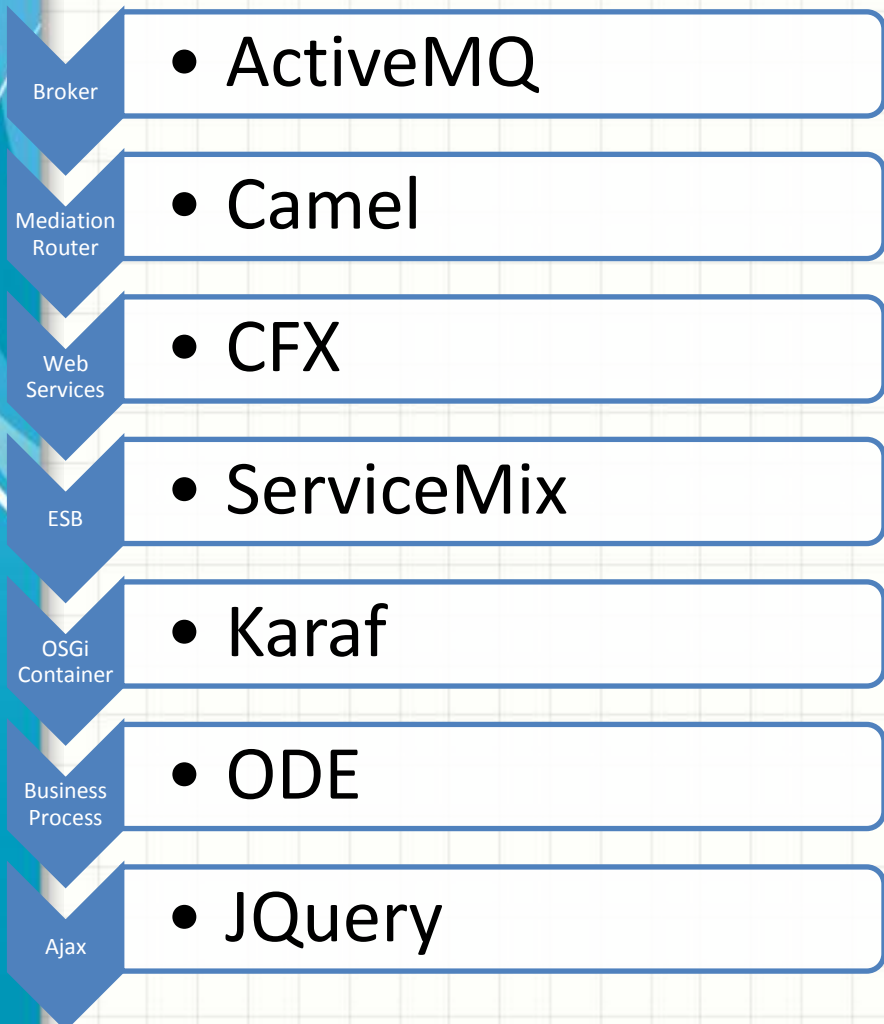

## Communication Styles

- Central broker
- Canonical data model
- Connector
- API
- Driver
- Shared memory
- Cache

# Market Landscape: 5-Tier

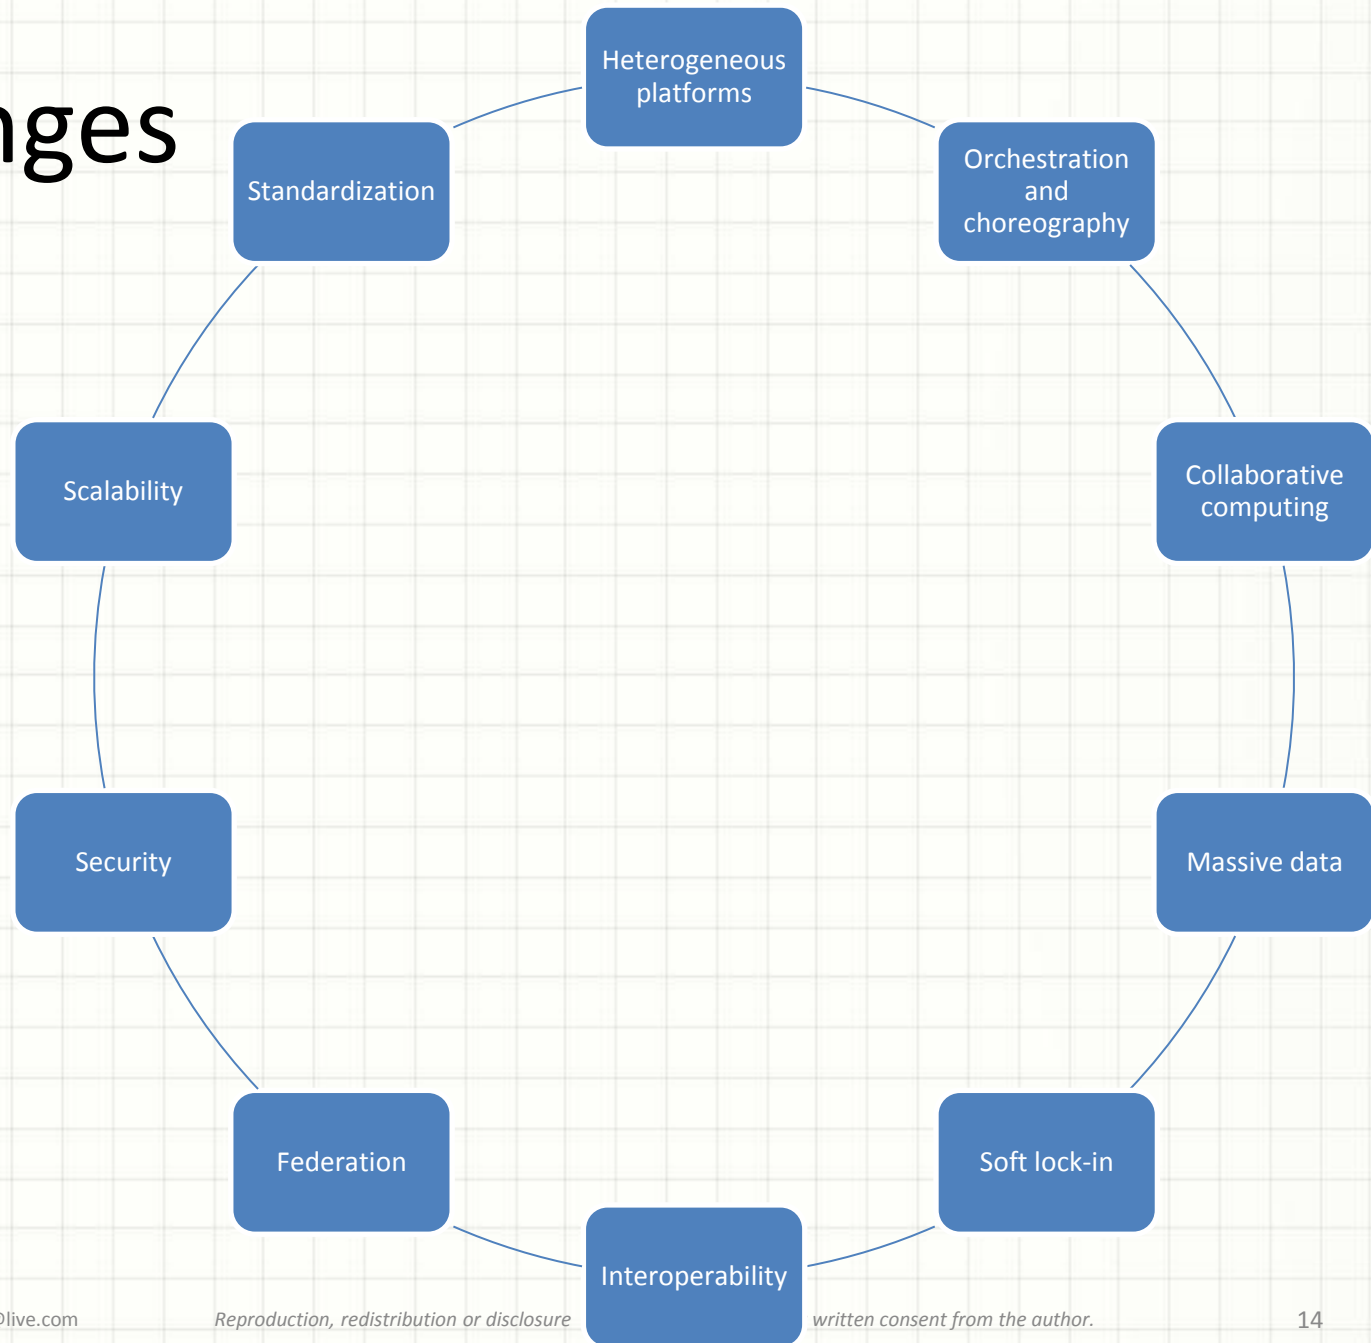

# Open Source Solutions for Integration Functions

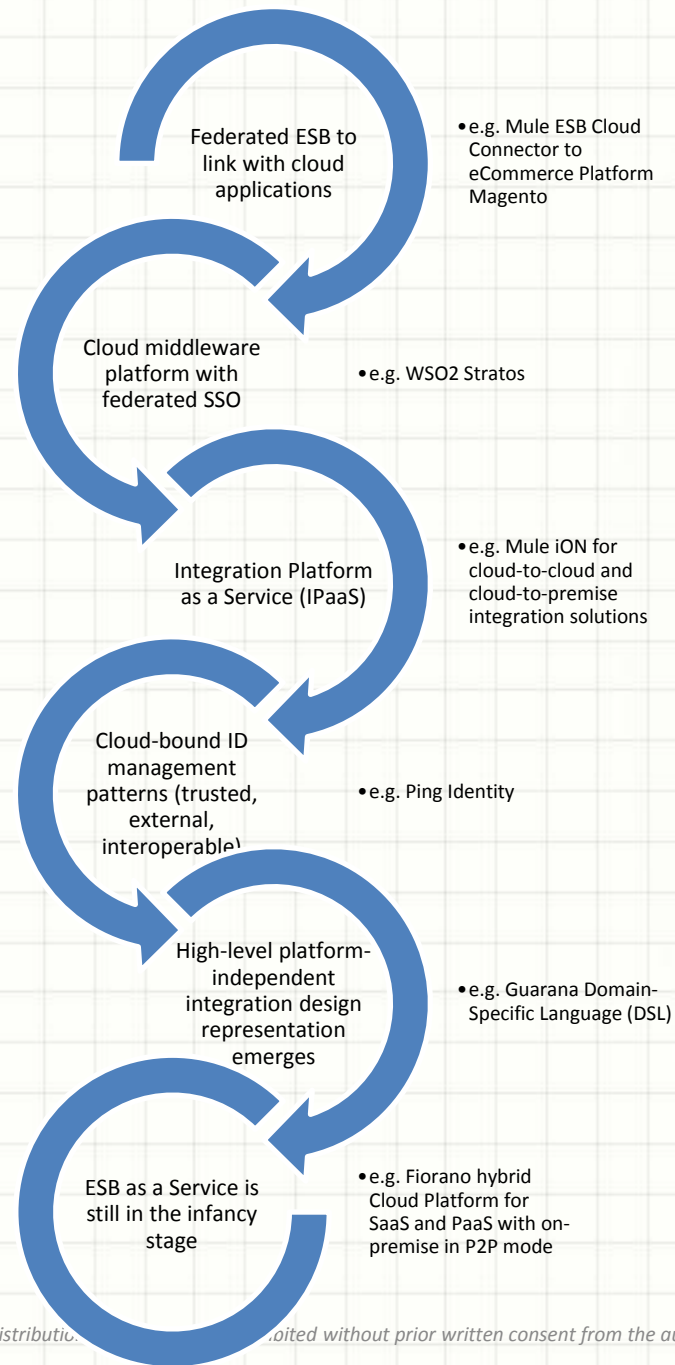

# Key Industry Leaders

| Vendor             | Solution                                                                        | Notes                                                               |
|--------------------|---------------------------------------------------------------------------------|---------------------------------------------------------------------|
| <b>Software AG</b> | webMethods product has long history. Bundle with CentraSite registry/repository | Largest number of ESB installations. Integrate with ARIS BPM.       |
| <b>Tibco</b>       | ActiveMatrix widely used – over 3000 installations                              | Integrate with BusinessWorks                                        |
| <b>Oracle</b>      | Rooted from BEA AquaLogic product                                               | More than 2600 implementations                                      |
| <b>Progress</b>    | Based on SonicMQ and Sonic ESB                                                  | Integrate with CIS and BPM solutions                                |
| <b>FuseSource</b>  | Spin-out from Progress, based on Iona                                           | Combine Apache integration solutions                                |
| <b>WSO2</b>        | Lean middleware                                                                 | Used in eBay for 1B transactions per day                            |
| <b>IBM</b>         | Websphere Message Broker, ESB, ESB Registry, Datapower Appliance                | 3 ESB products – 1 from Datapower and 2 from traditional middleware |
| <b>MuleSoft</b>    | 2500 deployments in production                                                  | Tcat for Enterprise Tomcat                                          |
| <b>Red Hat</b>     | JBoss ESB and SOA Platform                                                      | Data virtualization – aggregate data sources into a single view     |

# Challenges

# Trending

# Best Practices

Identify commonalities of business and technology integration needs

Decouple application linkage to reduce mutual awareness

Consider asynchronous communications (MOM and pub/sub)

Leverage integration patterns and styles

Start with a lower-cost and out-of-box integration solution

Explore the potential of open source ESB

Upgrade to a more robust solution as needs grow

Look into cloud alternatives

Drive two-prong cloud integration strategies

Take a hybrid deployment approach

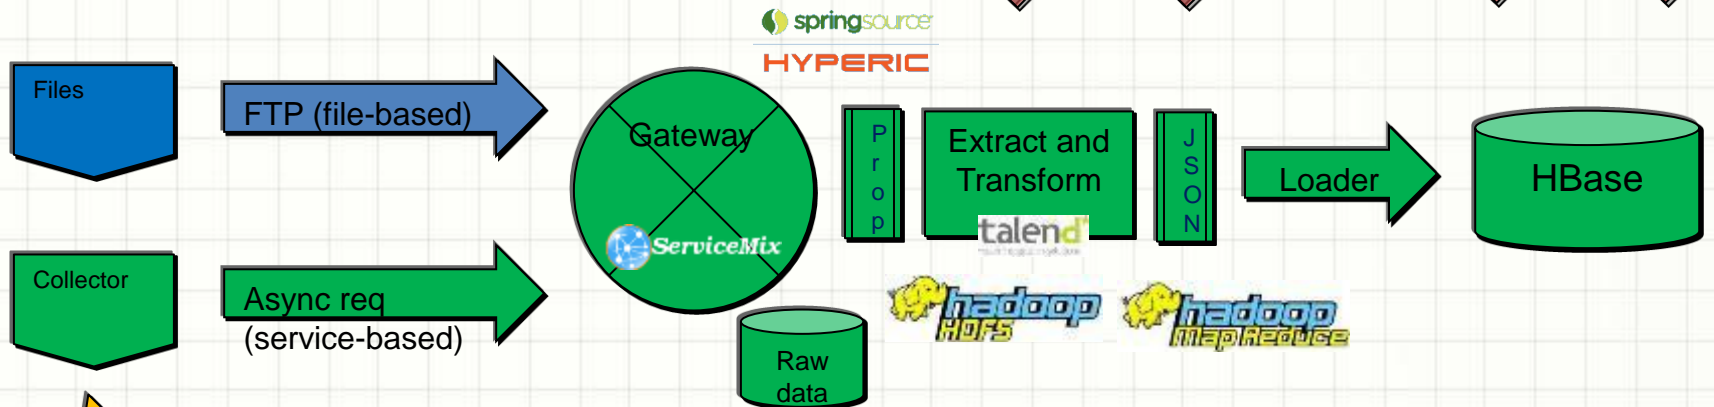

Treat security as a cross-cutting concern

Scale end-to-end

# Case Study: Integration for Big Data Ingestion

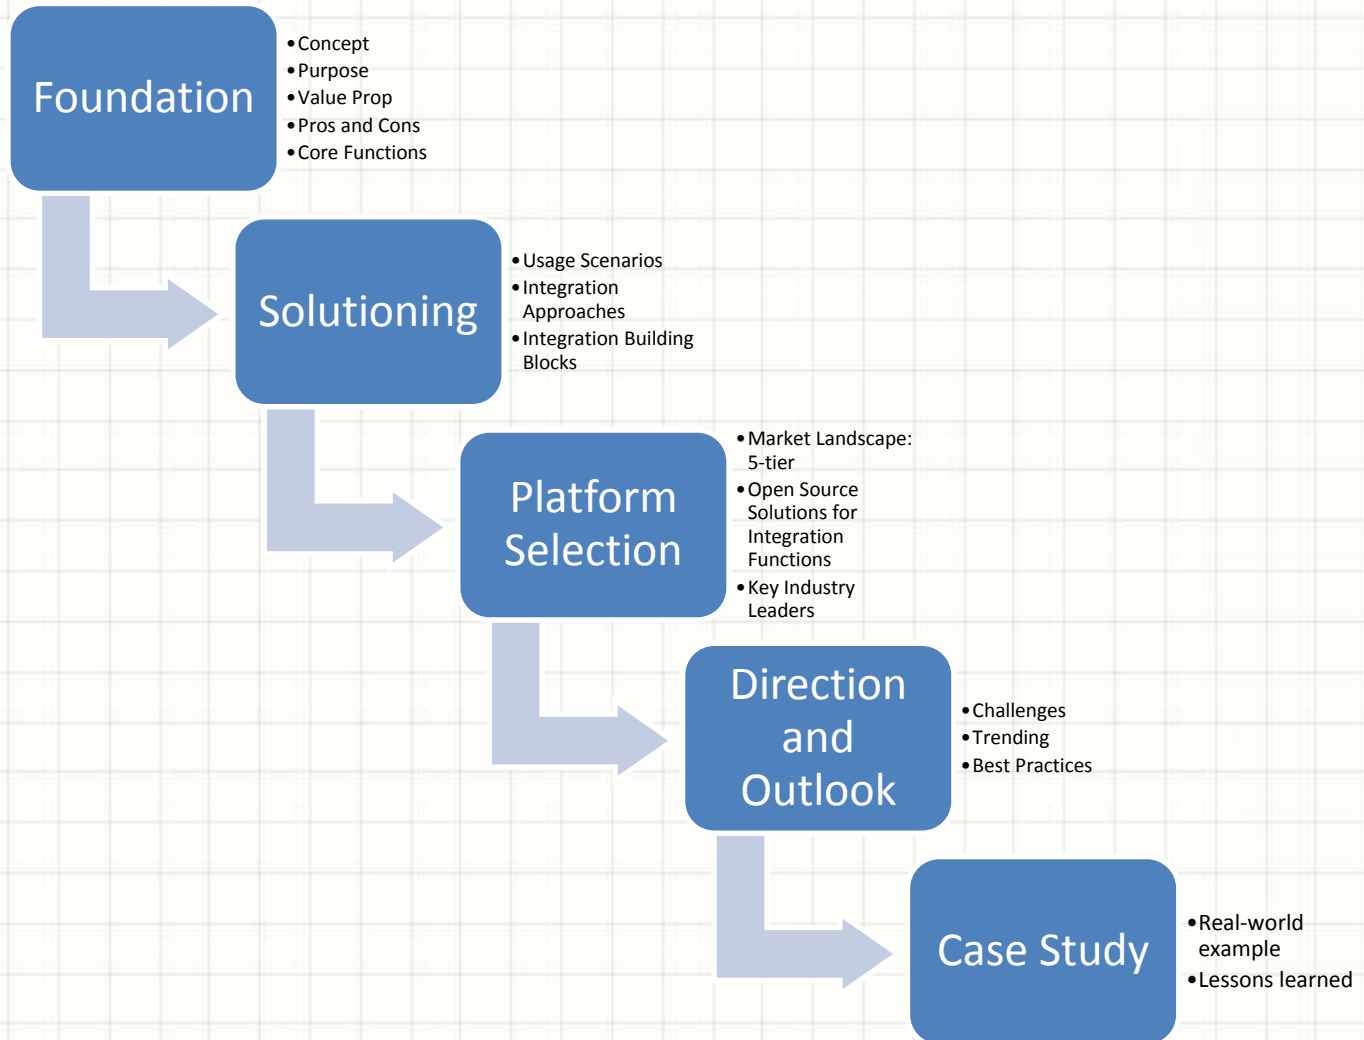

- Small batch
- Near real-time
- Streaming
- Javabeans, ActiveX, .Net
- Open source
- SDK

- Staging
- Queue
- Management
- Secure comm
- ESB
- ServiceMix/ FuseSource

- Monitoring
- Security
- Error handling
- Notification
- Talend
- Hyperic HQ

# Summary

ACCORDING TO THIS,  
THE PLANET EARTH WAS  
ONCE POPULATED BY  
HUMANS, THEN IN  
2012...

...THEY ALL  
MOVED TO THE  
CLOUD.
